FMTV Challenge 2016 Motivation for the Challenge

- Personal observation: risk of divergence between academic research and industrial practice is currently increasing
- Analysis method need to cope with complex mechanisms of modern automotive systems to be meaningful for practical use:
 - mixed preemptive and non-preemptive priority based scheduling
 - ▶ periodic, sporadic, and engine synchronous tasks
 - multi-core platform with distributed cause-effect chains including cross-core communication
 - ► label (i.e. data) placement dependent execution times of runnables
- Many current approaches only address parts of the above mentioned mechanisms
- Can those approaches be extended? Can they (conservatively) approximate the behavior? How tight are the analysis results?

FMTV Challenge 2016 **Characteristics of Automotive Software**

FMTV Challenge 2016 Characteristics of Automotive Software

- Runnable are the smallest executable units
- Are grouped into tasks, according to their activation scheme
- Execution time contains:
 - code fetch
 - no label access
 - no scheduling
- assumes certain memory layout

Hamann, Kramer, Ziegenbein, Lukasiewycz | 01/07/2016

FMTV Challenge 2016 Characteristics of Automotive Software

Communication between runnables is realized with reading and writing of labels

Communication	Share	Size	Share	Access type	Share	
Forward	25 %	Atomic (1-4 bytes)	97 %	Read-only	40 %	
Backward	35 %	Structs / Arrays	3 %	Write-only	10 %	
InterTask	40 %			Read-Write	50 %

FMTV Challenge 2016 SW model

- ► Key data of the model
 - ▶ 1250 Runnables mapped to
 - ► 21 Tasks & Interrupts accessing
 - ► 10.000 Labels (shared data)

- Huge amount of data dependencies
- challenge exact analysis methods

Ι	II	III	IV	V	VI	
<10	10-50	51-100	100-500	501-1000	>1000	

Period	1 ms	2 ms	5 ms	10 ms	20 ms	50 ms	100 ms	200 ms	1000 ms	sync
1 ms				Ι	Ι		Ι			Ι
2 ms				Ι	Ι		Ι			
5 ms		Ι	IV	IV	Π	Π	Ι			
10 ms	Π	Π	П	VI	IV	Π	IV	Π	III	IV
20 ms	Ι	Ι	Ι	IV	VI	Π	IV	Ι	Π	IV
50 ms			Π	Π	Π	Ш	Ι			
100 ms		Ι	Ι	V	IV	Π	VI	Π	III	IV
200 ms				Ι	Ι		Ι	Ι	Ι	
1000 ms				Ш	Π		III	Ι	IV	Ι
Angle- sync	Ι	Ι	Ι	IV	IV	Ι	ш	Ι	Ι	v

TABLE II. INTER-TASK COMMUNICATION

FMTV Challenge 2016 Effects of Data Access on ET

Status Quo

Execution time is measured

Assumptions

Similar SW (including mapping) and identical HW

Labels (data) are local

Improvements are needed for future use cases More fine grained SW models to evaluate effects of code decode stalls and data access wait states Effects are not negligible for upcoming platforms

~ 20% of execution time is due to code decode stalls

~20%-30% of execution time is due to data access wait states

FMTV Challenge 2016 Copy Mechanism for Data Consistency

10 Hamann, Kramer, Ziegenbein, Lukasiewycz | 01/07/2016

FMTV Challenge 2016 Cause-Effect Chains

Cause-Effect-Chains provide additional timing requirements that have to be met in order to ensure functional correctness

- Most chains are within one activation pattern ...
- ...but some span across multiple activation patterns, usually including angle synchronous domain
- Include between 2 and 5 runnables, with a write-read dependency

FMTV Challenge 2016 Use Cases / Challenges

- Precise analysis of worst-case end-to-end latencies along complex cause-effect chains
 - mainly due to different involved periods and time domains
- Interleaved WCET and WCRT analysis
 - What is the effect on memory layout and interconnect on the execution times of runnables?
- Automatic optimized application and data mapping
- Evaluation of digital (multi-core) execution platforms
 - ► Which platform suits best? Especially memory layout and interconnect.
- ► Evaluation of software growth scenarios
 - ► Can the current platform accommodate anticipated future features?

Questions ?
